

Website Audit Report

renewably.ie

Comprehensive Technical, SEO, Content, and Performance Audit

Prepared: 11 April 2026
Confidential

1. Executive Summary

This report presents a comprehensive audit of renewably.ie, a WordPress-based website operated by Renewably, an Irish digital marketing agency that positions itself as a "Leads as a Service" provider, primarily targeting renewable energy brands. The audit was conducted on 11 April 2026 and covers four critical dimensions: technical infrastructure, search engine optimisation (SEO), content quality and strategy, and overall performance. The findings reveal a website that was professionally built using modern tools but has suffered from significant neglect, with no meaningful content updates since September 2020, performance metrics that fall well below acceptable thresholds, and numerous SEO deficiencies that are almost certainly limiting organic visibility and lead generation capabilities.

The overall health score for this website is estimated at approximately 28 out of 100, which falls into the "Critical" category. This is primarily driven by an extremely slow page load time of approximately 87 seconds for full page completion, an entirely dormant blog with only one article published over five years ago, and a total absence of H1 heading tags on the homepage. The combination of these issues means that the site is likely losing potential clients through poor user experience, diminished search rankings, and a lack of fresh content that would otherwise establish authority and trust in the digital marketing space. Immediate remediation of the performance and content issues is strongly recommended to prevent further deterioration.

1.1 Overall Audit Scores

Category	Score	Rating	Priority
Technical SEO	25 / 100	Critical	High
On-Page SEO	30 / 100	Critical	High
Content Quality	20 / 100	Critical	High
Performance	10 / 100	Critical	Urgent
Accessibility	45 / 100	Poor	Medium
Security	55 / 100	Fair	Medium

Table 1: Overall Audit Scores by Category

2. Technical Infrastructure

The website is built on the WordPress content management system (version 6.5.8), which is a mature and widely supported platform. The site uses the Draven theme in conjunction with the Elementor page

builder (version 3.29.2) for visual layout construction. While the choice of WordPress is sound, the specific versions of the core software and plugins indicate that the site has not been kept up to date with the latest security patches and feature improvements. The site relies on a substantial plugin ecosystem, with at least eight distinct plugins detected, including All in One SEO, Contact Form 7, Header Footer Elementor, ActiveCampaign Subscription Forms, LaStudio Element Kit, and Convertful for popup overlays. While this plugin stack provides a comprehensive set of features, each additional plugin increases the attack surface for potential security vulnerabilities and adds to the overall page weight that must be downloaded by visitors.

2.1 Technology Stack

Component	Technology	Version	Status
CMS	WordPress	6.5.8	Update Available
Theme	Draven	1.0	Current
Page Builder	Elementor	3.29.2	Update Available
SEO Plugin	All in One SEO	4.9.5.1	Update Available
Forms	Contact Form 7	5.9.8	Current
Email Marketing	ActiveCampaign	N/A	Integrated
Analytics	Google Tag Manager	N/A	Configured
Popups	Convertful	N/A	Active

Table 2: Technology Stack Overview

2.2 Resource Loading Analysis

One of the most alarming findings of this audit is the sheer volume of resources required to load the homepage. The browser recorded a total of 36 JavaScript files and 40 CSS stylesheets being loaded on the initial page view. This represents an extraordinarily high number of HTTP requests for a website that essentially consists of a single landing page with some marketing copy, a few images, and a contact section. For context, industry best practice recommends keeping the total number of HTTP requests below 50 for the entire page load, and the most efficient modern websites achieve full functionality with fewer than 20 total requests. With 76 stylesheet and script resources alone, the site is placing an enormous burden on the browser and network stack, which is the primary contributor to the exceptionally poor load times documented in the Performance section of this report.

The proliferation of CSS and JavaScript files can be attributed to several factors. First, the Elementor page builder is known for generating a large number of individual CSS files for each page and widget configuration. Second, the LaStudio Element Kit adds its own layer of stylesheet files on top of the base

theme and Elementor styles. Third, multiple plugins each inject their own CSS and JavaScript resources without any form of consolidation or minification. The site does not appear to use any form of CSS or JavaScript concatenation plugin, nor is there evidence of a caching layer that would serve combined or minified assets. Implementing a caching solution such as WP Rocket, Autoptimize, or a server-level cache would dramatically reduce the number of individual requests and improve page load performance.

3. Performance Analysis

The performance metrics recorded for renewably.ie are exceptionally poor and represent the single most critical issue identified in this audit. The DOMContentLoaded event fired at approximately 73.5 seconds after the initial page request, and the full load event completed at approximately 86.9 seconds. These figures are orders of magnitude worse than industry benchmarks and would result in an almost immediate bounce from the vast majority of visitors. Research by Google indicates that 53% of mobile users abandon sites that take longer than 3 seconds to load, and the probability of bounce increases by 32% for every additional second of load time beyond 3 seconds. At nearly 87 seconds, this website is in a category that essentially guarantees visitor abandonment, making it extremely unlikely that any organic or paid traffic reaching the site would result in meaningful engagement or lead generation for the business.

Metric	Measured Value	Industry Benchmark	Rating
DOMContentLoaded	73.6 seconds	< 1.5 seconds	Critical
Full Page Load	86.9 seconds	< 3.0 seconds	Critical
JavaScript Files	36	< 15	Critical
CSS Stylesheets	40	< 10	Critical
Total HTTP Requests (JS+CSS)	76	< 30	Critical

Table 3: Key Performance Metrics

The root causes of these performance issues are multifaceted. The 76 combined JavaScript and CSS files create enormous network overhead, particularly on mobile connections where latency per request is higher. The lack of any apparent caching mechanism means that returning visitors receive no performance benefit from browser or server caches. The site loads the Facebook SDK (customer chat widget) synchronously in the document head, which blocks page rendering until the SDK has been downloaded and initialised. Additionally, the Convertful popup service adds yet another third-party script that must be resolved before the page can complete loading. Implementing deferred or asynchronous loading for all non-critical third-party scripts, consolidating CSS and JavaScript into fewer files, and adding a robust caching layer should be treated as the highest priority remediation tasks.

4. Search Engine Optimisation (SEO) Analysis

The SEO audit reveals numerous deficiencies that are likely severely limiting the organic search visibility of renewably.ie. Despite having the All in One SEO plugin installed and configured, the implementation falls short of best practices in several critical areas. The meta description is set to "Your unfair advantage is us!" which, while catchy as a tagline, provides zero context for search engines about the actual content and purpose of the website. A well-crafted meta description should be between 150 and 160 characters, incorporate primary target keywords, and clearly communicate the value proposition of the page. The current description fails on all three counts and is unlikely to generate strong click-through rates from search engine results pages, even if the site were to rank for relevant queries.

4.1 On-Page SEO Issues

Issue	Severity	Details
Missing H1 Tag	Critical	The homepage has zero H1 heading tags. The H1 is the most important on-page SEO element and its absence signals to search engines a lack of clear page structure and topical focus.
Vague Meta Description	High	The description "Your unfair advantage is us!" is only 28 characters, far below the recommended 150-160 character range, and contains no target keywords or value proposition.
Missing OG Image	Medium	No Open Graph image is set, meaning the site will display without a preview image when shared on social media platforms such as Facebook, LinkedIn, and Twitter.
Low Content Depth	High	The homepage contains only approximately 2,700 characters of visible text, which is insufficient to establish topical authority for competitive digital marketing keywords.
Duplicate Footer Content	Medium	The footer content is duplicated on every page, including the contact section, effectively doubling the content in some areas and creating a poor user experience.
Copyright Year Outdated	Low	The copyright notice reads 2024, which should be updated to the current year to convey that the website is actively maintained.

Table 4: On-Page SEO Issues Identified

4.2 Heading Structure Analysis

A proper heading hierarchy is essential for both search engine crawlability and user accessibility. The homepage contains 13 H2 headings and zero H1 or H3 headings. This creates a flat heading structure

that makes it difficult for search engines to understand the relative importance of different content sections. The H2 headings include marketing messages such as "Your Unfair AD-vantage" and "Results Driven By Data", but without an H1 tag to establish the primary topic of the page, search engines must infer the page theme from less reliable signals. Additionally, several H2 tags are duplicated (for example, "Let's meet", "Quick Links", "Company", and "Social Links" each appear twice in the footer area), which further dilutes the heading signal and creates redundancy in the document outline. A well-structured page should have exactly one H1 tag, followed by H2 tags for major sections, and H3 tags for subsections where appropriate.

Heading Level	Count	Expected	Status
H1	0	1	Missing
H2	13	3-6	Excessive / Duplicated
H3	0	2-8	Missing

Table 5: Heading Structure Analysis

5. Content Quality Audit

The content audit of renewably.ie reveals a website that appears to have been abandoned or placed into a dormant state since approximately September 2020. The site consists of five main pages: Home, About Us, Services, Blog, and Contact Us. While the Home, About Us, and Services pages contain reasonably written marketing copy that clearly communicates the company's value proposition around lead generation and digital marketing for renewable energy brands, the Blog and Contact pages are critically underdeveloped. The blog contains only a single article titled "A Software First Future" published on 7 September 2020, which is over five and a half years old. This is a significant red flag for both SEO performance and credibility with potential clients, as a regularly updated blog is one of the most effective ways to demonstrate industry expertise and maintain organic search visibility.

5.1 Page Content Summary

Page	URL	Content Size	Assessment
Home	/	2,696 chars	Thin; needs expansion
About Us	/about-us/	5,203 chars	Adequate
Services	/services/	4,263 chars	Adequate
Blog	/blog/	1,305 chars	Critical: 1 article from 2020

Contact Us	/contact-us/	728 chars	Critical: mostly duplicated footer
------------	--------------	-----------	------------------------------------

Table 6: Page Content Summary

The Contact Us page is particularly problematic, containing only 728 characters of actual content, with the majority of the visible text being a duplicated footer block that appears identically on every page. The page includes a "Book a Call" call to action, a phone number (+353 873958424), and an email address (cal@renewably.ie), but lacks a physical address, business hours, a map, or any substantive information that would help potential clients understand how to engage with the company. Additionally, despite Contact Form 7 being installed as a plugin, no form is actually rendered on the homepage or contact page, which represents a missed opportunity for lead capture. The absence of case studies, testimonials, team profiles, and a portfolio further weakens the site's ability to convert visitors into paying clients.

6. Accessibility Assessment

Accessibility is an increasingly important consideration for websites, both from a legal compliance perspective (particularly under the European Accessibility Act which applies to Ireland) and from a business perspective, as accessible websites tend to perform better in search rankings and provide a better experience for all users. The audit identified several accessibility concerns on renewably.ie that should be addressed. The viewport meta tag includes the directive "user-scalable=no", which prevents users from zooming in on the page content using pinch-to-zoom or browser zoom controls. This is a violation of WCAG 2.1 Success Criterion 1.4.4 (Resize Text) and can create significant difficulties for users with visual impairments who rely on zooming to read content.

Issue	Severity	WCAG Criterion	Recommendation
user-scalable=no in viewport	High	1.4.4	Remove user-scalable=no from the viewport meta tag to allow users to zoom.
7 of 13 images missing alt text	High	1.1.1	Add descriptive alt text to all images for screen reader compatibility.
No skip navigation link	Medium	2.4.1	Add a "Skip to main content" link at the top of the page.
No visible focus indicators	Medium	2.4.7	Ensure all interactive elements have visible focus styles for keyboard navigation.
No ARIA landmarks	Low	1.3.1	Add ARIA roles (banner, nav, main, contentinfo) to major page sections.

Table 7: Accessibility Issues

Of the 13 images detected on the homepage, 7 are missing alt text attributes entirely. This means that screen reader users, who depend on alt text to understand the content and purpose of images, will have no information about more than half of the visual content on the page. Search engine crawlers also rely on alt text to understand image content, so missing alt attributes represent a double penalty in terms of both accessibility and SEO. Additionally, the site does not appear to include a skip navigation link, which is a simple but important feature that allows keyboard users to bypass repetitive navigation menus and jump directly to the main content area.

7. Security Considerations

While a comprehensive security penetration test is beyond the scope of this audit, several security-related observations were made during the technical analysis. The site does use HTTPS with a valid SSL certificate, which is the minimum requirement for modern web security and is factored into Google's search ranking algorithm. However, several potentially sensitive WordPress endpoints are publicly accessible and exposed. The WordPress REST API is available at the `/wp-json/` path, which could potentially be used to enumerate user data or post content. The XML-RPC interface at `/xmlrpc.php` is also exposed, which has historically been a target for brute-force login attacks. The Really Simple Discovery (RSD) endpoint at `/xmlrpc.php?rsd` is additionally exposed, which discloses information about the blogging API endpoints supported by the site.

Finding	Risk Level	Recommendation
HTTPS enabled	Good	SSL certificate is valid and properly configured.
WordPress REST API exposed	Medium	Restrict REST API access to authenticated users only or disable public endpoints.
XML-RPC endpoint exposed	Medium	Disable XML-RPC unless explicitly required for remote publishing.
RSD endpoint exposed	Low	Remove RSD link from the HTML head if not needed.
Plugin versions visible	Medium	Obfuscate plugin version numbers in CSS/JS file paths to reduce reconnaissance.
Logo URL points to different domain	Low	The logo URL references <code>renewably.alphardx.com</code> instead of <code>renewably.ie</code> , suggesting an incomplete migration or staging environment reference.

Table 8: Security Findings

An additional finding of note is that the organisation logo in the structured data (Schema.org JSON-LD) and favicon references point to the domain `renewably.alphardx.com` rather than `renewably.ie`. This suggests that the site may have been originally developed or staged on a different domain and the

migration was not fully completed. Cross-domain resource references can cause mixed content warnings, impact browser caching efficiency, and potentially create trust issues if the referenced domain expires or is compromised. All internal asset references should be updated to use the production domain consistently.

8. Prioritised Recommendations

Based on the findings documented in this report, the following recommendations are presented in order of priority. Each recommendation includes an estimated impact assessment and the level of effort required for implementation. The recommendations are organised into three tiers: immediate actions that should be taken within the first week, short-term improvements achievable within one month, and medium-term strategic initiatives that should be planned for the next quarter.

8.1 Immediate Actions (This Week)

Recommendation	Impact	Effort	Details
Add H1 tag to homepage	High	Low	Add a single, keyword-rich H1 heading to the homepage template summarising the page's core topic.
Remove user-scalable=no	High	Low	Update the viewport meta tag to allow user zooming for accessibility compliance.
Update meta descriptions	High	Low	Rewrite all page meta descriptions to 150-160 characters with target keywords and clear value propositions.
Add alt text to all images	Medium	Low	Write descriptive alt attributes for the 7 images currently missing them.
Update copyright year	Low	Low	Change the copyright notice from 2024 to 2026 in the footer template.

Table 9: Immediate Actions

8.2 Short-Term Improvements (Within 1 Month)

Recommendation	Impact	Effort	Details
Implement caching	Critical	Medium	Install and configure a caching plugin (WP Rocket, W3 Total Cache) to reduce server response time and consolidate CSS/JS files.

Defer third-party scripts	Critical	Medium	Load Facebook SDK, Google Tag Manager, and Convertful asynchronously or with deferred loading to prevent render blocking.
Publish blog content	High	Medium	Create and publish at least 4-6 new blog articles on digital marketing topics for the renewable energy sector.
Add contact form	High	Low	Deploy a Contact Form 7 form on the Contact Us page to capture visitor inquiries directly.
Fix logo domain reference	Medium	Low	Update all references from renewably.alphardx.com to renewably.ie in structured data and asset URLs.
Add OG image	Medium	Low	Configure an Open Graph image for social sharing previews on all key pages.

Table 10: Short-Term Improvements

8.3 Medium-Term Strategy (1-3 Months)

Recommendation	Impact	Effort	Details
Add case studies and testimonials	High	High	Create dedicated case study pages showcasing successful client campaigns with measurable results.
Expand content depth	High	Medium	Significantly expand homepage and service pages to 2,000+ words each with comprehensive service descriptions.
Regular blog schedule	High	Medium	Establish a content calendar with bi-weekly blog posts on renewable energy marketing, lead generation, and industry trends.
Security hardening	Medium	Medium	Disable XML-RPC, restrict REST API access, obfuscate plugin versions, and implement a web application firewall.
Full accessibility audit	Medium	High	Conduct a comprehensive WCAG 2.1 AA compliance audit and remediate all identified issues.
Performance monitoring	Medium	Low	Set up Google Lighthouse CI, Core Web Vitals monitoring in Search Console, and real user metrics tracking.

Table 11: Medium-Term Strategic Recommendations

9. Conclusion

The audit of renewably.ie reveals a website that was professionally constructed using a modern WordPress technology stack but has fallen into a state of significant disrepair. The most critical finding is the extreme page load time of approximately 87 seconds, which makes the site effectively unusable for the majority of visitors and is almost certainly causing a near-total bounce rate from any traffic reaching the site. This performance issue alone would justify an immediate and comprehensive remediation effort, but it is compounded by a range of additional problems including missing H1 tags, a dormant blog with no content updates in over five years, vague meta descriptions, accessibility violations, and exposed security endpoints.

On the positive side, the site does have a solid foundation with HTTPS properly configured, a clear value proposition for its target market, and a professional visual design. The core service pages (About Us and Services) contain reasonably well-written marketing copy that effectively communicates the company's offerings. The immediate actions identified in this report, such as adding an H1 tag, updating meta descriptions, and fixing viewport settings, can be implemented in a matter of hours at virtually no cost. The short-term improvements, particularly the implementation of caching and script optimisation, have the potential to reduce page load times from 87 seconds to under 5 seconds, which would transform the user experience from unusable to competitive. With a sustained content strategy and ongoing technical maintenance, renewably.ie has the potential to become an effective lead generation tool for the business.
